

GenXCheck

Data Quality Control for Knowledge Management

GenXCheck allows any user to define a set of rules to perform **complex quality control** on any database. Quality Control (QC) will allow you to **maximize the potential** use of your existing data.

Custom designed profiles contain specially designed QC rules to verify the **domain specific data integrity**.

Easy to understand reporting allows fast **identification of erroneous data**. Reports can be used as an investigation tool for identifying incorrect data which can then be rectified using the original application.

Easy to Use

An **intuitive user interface** allows even the most novice of users to navigate into a database. A graphical **'Drag & Drop' Rule creation system** allows checking rules to be constructed visually rather than using a complex scripted language.

'Run Time' Version

GenXCheck RT is an **independent module** that is capable of applying a predefined 'Check Profile' created by an advanced user and can be run by anyone with **minimum IT knowledge**.

Newly entered data can be checked and a detailed, easy to understand report will highlight any data discrepancies allowing **true data Quality Control**.

Benefits

Define Quality Control rules graphically.

Maximize the potential of your existing data.

Quickly visualize erroneous data and generate detailed reports.

Guarantee your domain specific data integrity.

Works on any database.
